

CAVITY CASE WITH CLIP/PLUG FOR USE ON MULTI-MEDIA CARD

ABSTRACT OF THE INVENTION

[0040] An electronic device such as a storage device or memory card comprising a unitary case having opposed first and second sides, a closed first end, an open second end, and an interior chamber collectively defined by the first and second sides and the first end. Disposed within the second side of case is a window which communicates with the interior chamber thereof. Disposed within the interior chamber is a substrate having a plurality of contacts. The substrate is oriented within the interior chamber of the case such that the contacts are exposed within the window thereof. The substrate is maintained in a prescribed position relative to the case by a spring clip which is also advanced into the interior chamber and is cooperatively engaged to the substrate.
